Meta Ads Instant Form - WebHook Integration

Pre-Requisites:

1. Meta Ads Account with an Instant Form.
2. Meta Developer Account.
3. Working WebHook endpoint.
4. A WebHook secret. (Generate one here: https://dev-toolkit.madishtech.com/generate/secret)

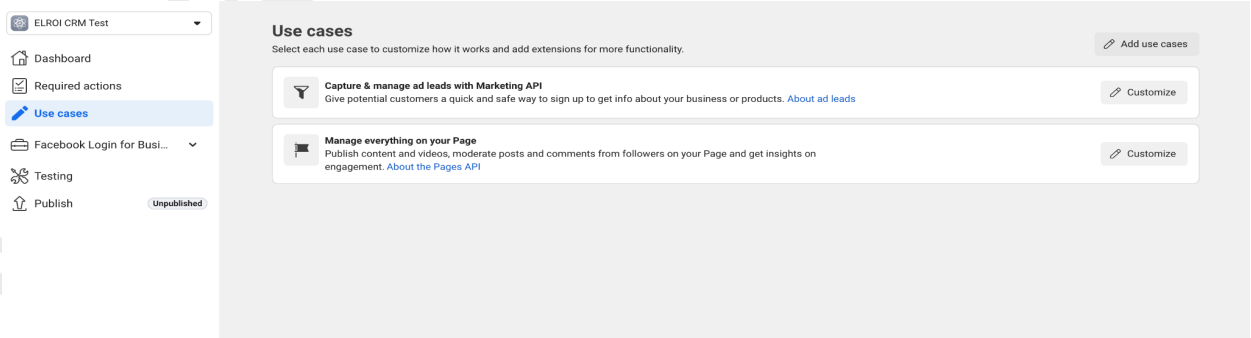
Steps to Configure:

Creating Developer App:

1. Go to https://developers.facebook.com/apps/creation/ and login with your Meta Developer account.
2. Provide the app name and contact email.
3. Select the following two use cases.
    a. Capture & manage ad leads with Marketing API
    b. Manage everything on your Page
4. Select valid Business Portfolio which has verification complete.
5. Review and Create the App.

Configuring Developer App:

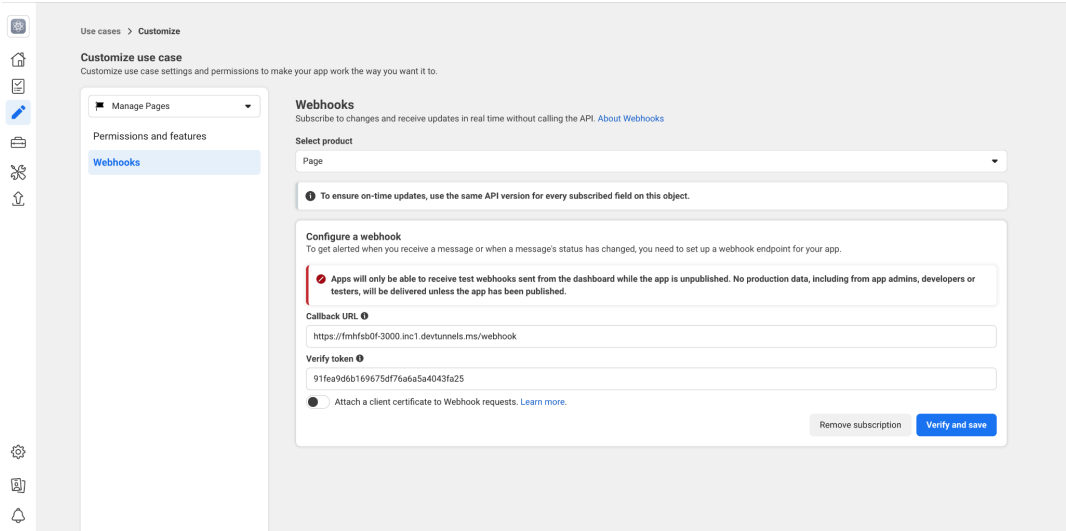
1. In the App Dashboard, go to Use cases and click on Customize for the Capture & manage ad leads with Marketing API.



2. Ensure the following permissions are added and enabled.
    a. leads_retrieval
    b. ads_management
    c. pages_manage_ads
    d. pages_show_list
    e. pages_read_engagement

Madish Technologies

3. Follow the same steps for Manage everything on your page use case and ensure the following permissions are added and enabled.
    a. pages_manage_metadata
    b. pages_show_list
    c. pages_read_engagement
4. Inside the Manage everything on your page use case navigate to the WebHooks section.



5. Select the Product as Page and enter the WebHook URL and the generated secret as the Verify Token.
6. Verify and Save.
7. Once verified, in the WebHook fields list, subscribe to **leadgen.**
8. Go to your Business Manager -> Settings https://business.facebook.com/settings/ under Accounts -> Apps ensure the newly created App is listed. If not, add the app with APP ID. It will be found in the App Dashboard -> App Settings -> Basic.
9. In Business Manager, Uses -> System Users section create a new System User with Admin Role.
10. Click on Assign Assets for the newly created System User. Apps -> Select the app created -> Enable Full Control.
11. Go back to the Developer Dashboard -> App Settings -> Basic. Enter Privacy Policy URL and the category as Business and Pages.
12. Navigate to the Publish section in the Dashboard and Publish the app.

Client Side Business Configuration

1. Client should go to their Business manager -> Settings (https://business.facebook.com/settings/)
2. Under Users -> Partners, Click Add and select Give a partner access to your assets.
3. Client should enter developer Business Portfolio ID which can be found in your Business Manager -> Settings -> Business Info.
4. Clients should select the page the ads account is connected to and give Full control except for sensitive actions. They also should select the ad account and enable Manage campaign ads permission.

5. Clients should go to Integrations -> Lead access in Business manager settings -> CRMs tab, assign CRM and select your app. If it's not visible, then complete till Step 3 in the next section and try this step again after a few minutes.

Client Configuration at Developer end

1. Go back to Developer Business Manager.
2. Under Users -> System Users -> Admin user which was created earlier and click on Assign assets.
3. Add the Client's Ad account and Facebook page.
4. Generate a new token with expiration as never.
5. Select the following permissions.
    a. ads_management
    b. ads_read
    c. business_management
    d. leads_retrieval
    e. pages_manage_ads
    f. pages_manage_metadata
    g. pages_read_engagement
    h. pages_show_list
6. Copy the Generated Token. This will be your **SYSTEM_USER_TOKEN**.
7. From your terminal or any http client make the following request.

```
curl -i -X GET \
  "https://graph.facebook.com/v25.0/me/accounts?access_token=YOUR_SYSTEM_USER_TOKEN"
```

8. The response will have the Pages that the system user has access to. It will have the **id** and **access_token** (**PAGE_ACCESS_TOKEN**).
9. Map these fields in your CRM.
10. Call the following endpoint to install the all in your Client's page.

```
curl -i -X POST \
  "https://graph.facebook.com/v25.0/YOUR_PAGE_ID/subscribed_apps" \
  -d "subscribed_fields=leadgen" \
  -d "access_token=YOUR_PAGE_ACCESS_TOKEN"
```

11. You should get success true in the response and the installation can be verified again by hitting the following endpoint.

```
curl -i -X GET \
  "https://graph.facebook.com/v25.0/YOUR_PAGE_ID/subscribed_apps?
access_token=YOUR_PAGE_ACCESS_TOKEN"
```

Testing:

1. Go to Ads Lead Testing tool (https://developers.facebook.com/tools/lead-ads-testing)
2. Select your client's page, product as Lead Retrieval, select the instant form that you want to test and click on Create Lead. Delete lead if there is an existing one present as Meta allows only one Lead to be tested at a time.

WebHook:

1. Should be called when someone fills the Instant Form or when triggered via the Test Tool.
2. Validate the calls using the Page ID, FormID (From the Business Portfolio Instant Forms)
3. Map the form_id, page_id or any other field required against the CRM fields. These values can be derived from the test data or from the Business Manager.

Madish Technologies

Sample Integration:

```
const express = require("express");
const app = express();
app.use(express.json());

const VERIFY_TOKEN = "91fea9d6b169675df76a6a5a4043fa25";

// Store per-client page tokens — load from your DB or env
const PAGE_TOKENS = {
  PAGE_ID: "PAGE_ACCESS_TOKEN",
};

// Verification — Meta calls this once when you save the webhook
app.get("/webhook", (req, res) => {
  const mode = req.query["hub.mode"];
  const token = req.query["hub.verify_token"];
  const challenge = req.query["hub.challenge"];

  if (mode === "subscribe" && token === VERIFY_TOKEN) {
    res.status(200).send(challenge);
  } else {
    res.sendStatus(403);
  }
});

// Lead events — Meta calls this on every new lead
app.post("/webhook", async (req, res) => {
  res.status(200).send("EVENT_RECEIVED"); // Respond immediately

  const body = req.body;
  console.log("Received webhook:", JSON.stringify(body, null, 2));

  if (body.object !== "page") return;

  for (const entry of body.entry) {
    const pageId = entry.id;
    const pageToken = PAGE_TOKENS[pageId];

    for (const change of entry.changes) {
      if (change.field === "leadgen") {
        // Map form_id, page_id, ad_id to your CRM's form and campaign IDs if needed
        const { leadgen_id, form_id, ad_id, page_id } = change.value;

        const response = await fetch(
          `https://graph.facebook.com/v25.0/${leadgen_id}?
fields=id,created_time,ad_id,form_id,field_data&access_token=${pageToken}`,
        );
        const lead = await response.json();
        console.log("Fetched lead details:", JSON.stringify(lead, null, 2));

        // lead.field_data has all form fields
        // Push to your CRM here
        console.log(`Client Page ${pageId}:`, lead.field_data);
      }
    }
  }
});

app.listen(3000, () => console.log("Webhook server is listening on port 3000"));
```

Sample WebHook Response:

```
{
  "entry": [
    {
      "id": "1619996624993752",
      "time": 1774258085,
      "changes": [
        {
          "value": {
            "created_time": 1774258082,
            "leadgen_id": "920850877480795",
            "page_id": "1619996624993752",
            "form_id": "1459077345889153"
          },
          "field": "leadgen"
        }
      ]
    }
  ],
  "object": "page"
}
```
